This prompt can appear very quickly, so you must watch for it to display, and then press. If you press before you are prompted, this keystroke will be lost. Then, shut down your computer and try again. Information on the screen is divided into three areas: the options list, active options field, and key functions. As an option is highlighted, the Option Field displays more information about that option and the options current and available settings. By pressing or the left and right arrow keys, you can toggle between a primary topic collapsed and subtopics expanded. Press to make that selection active. This option also displays a table that describes the memory size, whether the memory module is ECC capable, single or dual rank, type, and organization. To boot from a USB memory device, select the USB device and move it so it becomes the first device in the list. Off disables all floppy drives. USB enables the USB floppy drive. Internal the default setting enables the internal floppy drive. Read Only enables the internal drive controller and allows the internal floppy drive read-only permission. On the default setting enables the interface so that the device can be used. On the default setting enables the interface so that the device can be used. If a boot routine is not available from the network server, the computer attempts to boot from the next device in the boot sequence list. The factory default setting is No Boot. Settings are reversed if a PCI video controller is installed in a 64bit PCIx expansion slot. The performance of some applications may improve with an additional core enabled. The default is On second core enabled. However, some drives may not see an increase in data transfer

When the field is locked, you can no longer disable password security by pressing when the computer starts. Also, a valid Admin password is required to change the system password defaults to Unlocked. On is the default setting. On restarts the computer when power is restored after an outage. Last returns the computer to its last state before power was removed. Off is the default setting. Choices are every day or every Monday through Friday. Change the startup time by pressing the right or left arrow key to increase or decrease the numbers, or type numbers in both the date and time fields. The default setting is On. The default setting is Cancel. When set to On default, this option activates the numeric and mathematical features shown at the top of each key. When set to Off, this option activates the cursor control functions labeled on the bottom of each key. If the floppy in the drive is not bootable, the computer attempts to boot to the hard drive. If no operating system is on the drive, the computer attempts to boot to the next bootable device. If no CD is in the drive, or if the CD has no operating system, the computer attempts to boot to the next bootable device. Press the key to retry the boot, or press the key to enter the setup utility. To ensure that your device is bootable, check the device documentation. Then shut down your computer and try again. Each device has a number next to it. To make sure your device is bootable, check the device documentation. It is not advised to spend any money upgrading this system, as it is cheaper to purchase a more capable Second Hand Business Desktop. New untested. Learn how your comment data is processed. In 2007, the Dimension series was discontinued and replaced with the Dell Inspiron series for lowend models and the Dell Studio series for higherend models. The E520, E521 and C521 were reintroduced under the Inspiron line under the names Inspiron 530, 531, 530s and 531s, with a revised case design. The earlier version used the i850 chipset with a Socket 423, while the later version used the i850E chipset with a Socket 478. By using this site, you agree to the Terms of Use and Privacy Policy. It has a Pentium D cpu, PNY 6800GS gpu, 375 watt psu and 4gbs2x2 of Corsair ddr2 800 ram.

My sister had it for a while and just got it back recently. When I first got it back, it would start up fine and Windows would load fine although it was acting a little wierd. So I figured on reinstalling Windows XP. I have not reinstalled Windows yet and now when I turn it on, all the fans spin up and I can hear the hard drives engage but nothing shows up on the screen. The power button turns orange as soon as I hit the button but should be green. It does not beep either. I even took the ram out and it still did not beep. I tried to clear the cmos and no luck. It has two sets of jumpers and I moved both of them and no luck. On one of the sets, it will not come on at all if I move it. I dont know if that has anything to do with it. Since it did not beep when I took the ram out, I am thinking it is the motherboard but not sure. If it is the motherboard, I would imagine it would be a waste of time and money to buy a replacement. A device might be malfunctioning or incorrectly installed. Remove and then reinstall the memory modules see page 66. Remove and then reinstall any cards see page 68. A device might be malfunctioning or incorrectly installed. Remove and then reinstall any cards see page 68. I was thinking the motherboard since it did not post when I took the ram out. Is there any way to be certain that it is the motherboard. If it is the motherboard, would it be a waste to try and find a replacement. And where would I find one at Shouldnt be too hard to find a board that supports Pentium D though, I imagine most 775 boards do. I was thinking the motherboard since it did not post when I took the ram out. And where would I find one at I would try replacing the PSU first with a good quality low priced unit. If that does not fix the problem you can always keep it as a spare. There are a few motherbaords listed on ebay. You can also check spare parts places using google but their price is probably going to be higher.

The reason it would not come on at all is because I had the wrong cpu installed. I had a q6600 in there just to see if it would work with that board and it doesnt. So I put the original Pentium D back in and it comes on now but still can not get it to load windows. As soon as it gets to the Windows XP

loading screen, it restarts. So I thought I would just reinstall Windows and start fresh but the Windows setup does not recognize a hard drive. Bios recognizes it as well as Dban. I thought I would try to format it with Dban but I get an error with that as well. The only thing that I think could have happened is I took the drive out and installed it in an external enclosure that is connected to this computer. Could that have done something to it. If I cant get this thing going, that is not a big deal. I will just salvage what I can from it and pitch the rest. Would the motherboard, cpu, and psu be worth saving from it. I plan to build a PC for gaming maybe later this winter. Also the cable management is specific to that dell motherboard.

The CPU cooler is set up in such a way that it acts as the exhaust for the case and I dont think airflow would be good with an aftermarket cooler. They are actually nice cases so I can see why youd want to reuse it; Itd be more trouble than its worth though. My old one also used BTX. I tried changing the PSU is it once. It was the hardest thing in the world because the cable management is done is such a way that they just assume youre never going to mess with it. Its horrible.
